

AI-Assisted Software Development

Future and Next Steps

Mike Burton 17-19 March 2025

Techniques Coming Soon

1. Prompt cacheing

- Designate parts of a context as "static"
- To avoid processing them in every query
- Saves on token usage ie cost
- Improves performance

2. Claude Citation API

- Completion can contain reference to source documents
 - that were included into context
- Page of a PFS document
- Line and char reference of a text file

3. Model Context Protocol

- Simplifies "Tools API" which informs LLM of available "actions"
- Watch for emerging "MCP Server" implementations

Forthcoming Developments

1. Tessel.ai

- Developing a suite of AI-powered tools
 - to support coding
 - and other areas of software development lifecycle

2. pragmaticcoders.com/resources/ai-developer-tools

3. shiftasia.com/column/top-ai-tools-for-coding-navigating-the-ai-revolution-in-software-development/

4. Model providers blogs

- Anthropic, OpenAI, Mistral, DeepSeek, ...

Next Steps

1. Choose Tools

- Experiment with trial versions
- Map "preferred" tools to company strategy / budgets
- Avoid proliferation of tools ie costs

2. Remember Data Privacy

- Appropriate level of caution
- Be aware of Tool Vendor and Model Providers' policies

3. Keep Practicing!

- Actively seek areas to "delegate" to AI tools
- Look out for signs of context problems
- Keep an eye on LLM model developments
